What's new in Mochiboard

Each update gets a short line here. Mochiboard shows the new ones in Settings when an update is ready.
Write them for people, not for code: one line, what changed and why it's nice.

November 2026 · 1.9.0

- Tables: press B (or the new table tool) for a table on the board. Type in a cell, Tab and Enter move along (Enter on the last row adds one), the little + buttons add a row or column, and right-click → Table adds or deletes rows and columns or turns the header row off. Rows pasted from a spreadsheet, a web page or a CSV arrive as a table, and a table dropped into a doc stays a table.
- Saved text styles: right-click styled text → Save text style. Styles sit under Board colors; click one to put the same font, size, weight, spacing, case and title color on whatever you've selected (or start a new note in it).
- Highlighter mode in docs: Highlight → Highlighter mode, then drag over words. Drag again to erase; Esc puts it down.
- Archive projects: right-click a project → Archive. It leaves your lists but keeps every folder and board; Archived (under your projects, and at the bottom of the Boards list) lets you look inside or restore it.
- Color your canvases: click the little dot beside a board, folder or project (or right-click → Color) to give it a color. Folders turn that color in the list and on Home.
- Tell Jessa: right-click Mochi → Send feedback to Jessa, the Feedback button in Mochi's chat, or just “tell Jessa…”. You see exactly what goes out before it sends, and you can ask to be thanked by name if your idea ships.
- Support Mochi: a little Ko-fi pill in Settings → About.
- Thank-yous: ideas from people that ship get their own line on the What's new card.

October 2026 · 1.8.0

- Masks, the Figma way: pick a shape (or a pen line, or a cut-out) with anything under it, right-click → Mask, and it becomes the window onto them. Layers shows the mask group, you can drag things in and out of it, and there are ready-made circles, hearts, blobs and more.
- Combine shapes: Union, Subtract, Intersect and Exclude for drawn things, and Separate to take them apart again.
- A flowchart library: 14 templates with previews, from log in to bug triage, with swimlanes where there are handoffs. The Templates button sits first in the Flowchart tab, and Mochi places them offline too (“make a flowchart for checkout”).
- Flowcharts line themselves up: set a shape down near another and it connects and slides into line.
- Wireframe templates: the Templates button at the top of the Wireframing tab opens 12 common app flows (sign up, log in, forgot password, onboarding, checkout…) drawn out screen by screen, with the thinking beside each. One click adds the real, editable wireframes.
- Pictures grew up: crop inside the frame, drop shadows with a proper sheet, a stroke that works as a mat, corners that really are the corners, remove the background, drop a file on a picture to swap it, and save any picture as PNG or JPEG. Pull colors and Crop chips grow with the picture.
- Link cards show a screenshot of the page. Paste jessa.art without the https:// and it still reads as a link.
- Empty image spots show a pixel-Mochi scene that matches their label; drag a placeholder from the Wireframing pane onto any picture.
- Export as image draws only what you selected, on a transparent background, with tight edges.
- Learn: an 80-term UX dictionary and the design principle sets, inside the app, no Claude needed.
- Mochi says what she’s doing while she thinks, and does more without Claude: lo

gin flows, sitemaps from your notes, flowcharts.
- Right-click menus everywhere, lines included, with Arrange ▸ in each; arrow keys nudge; Esc closes anything.
- New stamps under New ✦: double Mochis, wings, devils and little flyers. Settings → Board → Pictures holds the picture options.

October 2026 · 1.7.4

- New boards start from Jessa’s poster: “You can literally do anything, if you dream it.” Every piece of it is movable; it’s a start, not a lesson. It’s in the Templates list as “Dream it” too.
- The Mac app is now signed and notarized with Apple, so it opens on the first double-click, with no “could not verify” warning and no trip to System Settings. Nothing else changed.

October 2026 · 1.7.3

- Bring to front and send to back work on everything now. Hovering a card no longer pops it to the top, so the order you set is the order you see.
- Screens stack like any card: bring one to the front and it covers loose notes, and its own pieces always ride on top of it.
- Pick a piece out of a group and it moves forward or back on its own; select the whole group and it moves as one.

October 2026 · 1.7.2

- Aligning respects groups: select a whole group and it lines up as one piece, keeping its own layout. Pick pieces out of a group and they line up on their own.

October 2026 · 1.7.1

- Updates find you even if Mochiboard stays open all day: it checks every hour and whenever you come back to it, then shows the banner (and with auto-update on, gets the update ready right away).

October 2026 · 1.7.0

- The Pen: draw any shape with points and curves. Double-click any shape to pull its points, round just the corners you pick, or make a corner smooth.
- Strokes on boxes, screens and shapes: solid, dashed or dotted, with your own dash and gap. No fill leaves a clean outline in the color it had.
- Squiggly lines: turn any line wavy, zigzag or loopy, then tighten it, round it, or give it a hand-drawn wobble.
- Text, your way: type any size, set line height and letter spacing, align left, center or right, and switch between UPPERCASE, lowercase and Title Case. Titles wrap when you resize them, notes and checklists grow as you type, and Shift-drag scales text with its box.
- Line things up: pink alignment guides for everything, buttons to align and space evenly, and rotate or scale several things at once.
- Name your Mochi in Settings → Mochi, and try Calm (she sits still) or Calmest (softer colors too). Calm modes were Nikunj Tyagi's idea, thank you ♡
- Settings → Toolbar: pick small, medium or large icons; anything that doesn't fit tucks into a ··· menu. Drag the bottom of your boards list, Layers, Wireframe or Unsorted to any height.
- Mochi's music plays right from its little pill, and the colors under the color wheel come from your board.
- Send feedback right from Settings → About.
- Fixes: the text bar always shows up, aligning works on the first click, the resize corner stays on its box, text stays sharp when you zoom in, lines show up in Safari, menus never hide behind Mochi, and the Windows update banner is back.

October 2026 · 1.6.1

- Documents open on top of your widgets again, instead of underneath them.
- The sound and captions buttons on videos match, and stay soft when you hover.

October 2026 · 1.6.0

- Make the sidebars yours: drag any widget by its title into a spot on either side (little boxes show where it can go). Turn widgets on and off in Settings → Widgets, where Reset layout puts everything back. The Boards panel always stays.
- Dress up Mochi: a new widget with hats, glasses, scarves, a balloon and more. Hover to try things on, click to wear them, and she wears her outfit everywhere she shows up.
- Mochi's music: a new widget with three little lo-fi songs (Strawberry Milk Beats, Cloud Desk and Jelly Jog) that loop seamlessly while you work. It never plays on its own.
- Bring to front and send to back: right-click a card, or press ⇧⌘] / ⌘] / ⌘[/ ⇧⌘[. Layers follows along.
- Click the zoom % at the bottom for Zoom in, Zoom out, 100%, Zoom to fit and quick sizes. Or press ⌘+, ⌘−, ⌘0 and ⇧1.
- Flip your camera: video cards mirror you like a selfie, or tap Flip to see the room the right way round. Your video saves just the way it looked.
- Videos can be written out too: tap the little captions button on a video, and what you said shows up underneath, ready to copy or turn into notes.
- Smoother on a Mac: hovering over notes no longer makes the board stutter, and the little Mochis use half the effort to animate.
- On Windows, Mochiboard talks about your PC, File Explorer and PowerShell, and the browser version shows Ctrl shortcuts on Windows and Linux.
- Without Claude, Mochi still writes out your voice memos and videos, and doesn't offer notes she can't make.

October 2026 · 1.5.1

- Hold Option (Alt on Windows) while you drag to make a copy, just like in Figma. Works on groups, frames and connected cards too.

October 2026 · 1.5.0

- Mochiboard for Windows! The same board on your PC, with Ctrl shortcuts. Download it from mochiboard.app.
- Text stays sharp at any zoom, even on boards with Spotify players or videos: once you stop zooming, everything is drawn fresh at the size you see. New pictures keep their full Retina detail too.
- Smoother zooming and panning: a pinch with little pauses no longer stutters, and the board waits until you're really done before redrawing everything sharp.
- Pick your camera and microphone in Settings → General, or from the little menu on video and voice memo cards. Remembered for next time.
- On Windows, voice memos get written out by Whisper, right on your computer. Mochi asks once; it's a one-time download.
- Updates and the tour now live in Settings → About.
- Spotify on your board: paste a link to a song, album, playlist, podcast or artist and it becomes Spotify's own player. Click it once, then press play.

October 2026 · 1.4.1

- Phone-shaped video recordings stay centered on every camera.

October 2026 · 1.4.0

- Pick a font for notes, titles, checklists and collections: any font on your Mac, with a live preview as you hover.
- Font menus start with the fonts already used on your board, including inside docs and wireframes, so it's easy to stay consistent.

- Voice memos wait for you: drop one on the board and press Start recording when you're ready. Nothing records by surprise.
- The grid can be dots, crosses, little x's, hearts, triangles, squares or sparkles. Pick one in Settings → Board.
- Video cards: record yourself with your camera (press V), wide or phone-shaped for reels and stories, or drop in a video file. Videos play right on the board, and you can scrub and mute them.
- Opening Settings lets go of whatever you had selected or were holding.
- Make the toolbar yours: right-click it (or go to Settings → General) to hide tools you don't use and drag the rest into your own order.

October 2026 · 1.3.2

- A quiet bar at the top of your board tells you when a new version is ready. Update now, or hide it until the next one. No more pop-ups.
- Updates can happen by themselves: say yes once and new versions slip in when you quit Mochiboard. Change it anytime in Settings → General.

October 2026 · 1.3.1

- Just the board: press ⌘\ (or the corners button by the zoom) to hide every panel. ⌘\ or Esc brings them back.
- GIFs keep moving when you add them to a board, and see-through PNGs stay see-through.
- Boards added from outside the app (like from Claude Code) show up right away, and Mochi tells you where to find them.
- Right-click while you're holding something (a sticker, a note to place, a shape) to put it down, just like Esc.

October 2026 · 1.3.0

- Switches in Settings show the Mochiboard pointer instead of a text cursor.
- Colors and the dot grid live under Settings → Board now.
- A phone layout: the board fills the screen, panels slide up from a hub at the bottom, and fingers pan, pinch and press-and-hold.
- The action bar's icons match the toolbar's, in size and color.
- Mochi finds Claude Code wherever it's installed, notices right away when you set it up, and explains when it isn't signed in. "Set up" opens a step-by-step guide.
- The window can shrink much smaller, and its edges show the Mac's resize arrows.
- The left panels' shadows fade softly instead of stopping in a hard edge.
- Docs are real documents now: styles (Title, Heading, Lead, Caption, Quote…), any font on your Mac, sizes, bold/italic/underline, colors and highlights from your board, alignment, lists, checklists, links, pictures, tables and line spacing.
- Select words in a doc and ask Mochi to make them shorter, clearer, friendlier, or anything you type.
- Cards dropped into a doc keep their shape: a checklist stays a checklist, a link stays a link.
- Download any doc as a PDF or a Word file (.docx), on Letter or A4 pages. Word files keep headings, lists, tables, links and pictures, with DM Sans built in.
- No more Mac beep when you delete things or use shortcuts on the board.
- In dark mode, the "pull colors" button on pictures is easy to read.

October 2026 · 1.2.1

- Click a layer and Mochi points it out on the board: a pink glow and a little wave from its corner.

October 2026 · 1.2.0

- Your own cursor: your name and a color you pick follow your mouse around the board.
- Your colors: change the board, dots, panels and accent in Settings, or right-click any board for its own background.
- Board colors: right-click a saved color to rename, change or remove it.
- Layers: everything on the board in one list. Pick, rename, hide, lock and drag to restack.
- Resize wireframe pieces: drag a piece's corner to reshape it, or double-click to reach inside a button or input.
- The resize corner always sits on top and stays the same size at any zoom.
- Drawing sizes: a slider for any thickness (and [ ] while drawing). The eraser has a size too.
- All 48 stamps are pixel art now.
- The starter boards (Moodboard, App plan, Brain dump) moved into the Templates menu.
- Smoother dragging and zooming on big boards, and the dots stay the same size as you zoom.

Earlier in October 2026

- The What’s new card uses Mochiboard’s own icons.
- Dark mode fixes: the templates menu and the stamp wheel’s + button are easy to see now.
- Design thinking templates in the toolbar: affinity map, opportunity map, impact / effort, empathy map, journey map, how might we, and rose, thorn, bud. Each comes with an example and a how-to note from Mochi.
- Mochiboard works without internet. Everything on the board keeps working; Mochi just tells you she'll think again once you're back online.
- Canvases can go anywhere: drag one onto another board, onto the open board, into a folder, or right-click and make it its own board.
- Settings has tabs now (General, Mochi, Helpers, Board, About), so it's easier to find things.
- See how much Claude Mochi has used, in Settings → Helpers, with a link to your plan's limits.
- Peach boards get their color dot back in the sidebar.
- A little “What’s new” card the first time you open a new version.
- You can download Mochiboard straight from jessa.art now, no Terminal needed. It runs on Apple chip and Intel Macs.
- Group anything together so it moves as one: select a few things, then Group (or ⌘G). Right-click to ungroup.
- Updates now live in Settings: Mochiboard tells you when there's a new version and updates with one tap.
- Folders can live inside folders. Drag one onto another in the sidebar or on Home.
- Copy and paste cards between boards with ⌘C and ⌘V. Collections keep their cards.
- Unsorted always fits on screen now, and its list scrolls.
- A friendlier Settings page, with a note from the person who made Mochiboard.
